

HEALTH IS LIFE'S FOUNDATION

Kittens and puppies have unique nutritional needs compared to adult cats and dogs. Several essential nutrients are required at specific levels to help support their healthy growth and development. Kitten and puppy diets should have precise and controlled nutrient concentrations including:

ENERGY

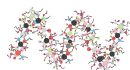

During the first 4 months of development, energy needs are **over two times higher** than those of a mature adult of the same body mass.*

MINERALS

Calcium & phosphorus contribute to:

Formation of bones and teeth

Production of protein for growth

Repairing of cells and tissues

VITAMINS

Vitamins are organic compounds that take part in a wide range of **metabolic activities**.

Vitamin deficiencies can lead to a wide range of clinical abnormalities that reflect the diversity of their metabolic roles.

PROTEINS

Dietary proteins provide structure for **maintenance and growth**:

hair & nails

ligaments, tendons,
bones, cartilage

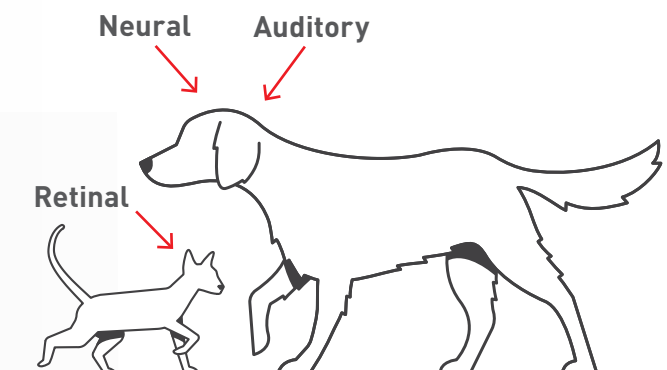

muscles

brain

DHA

DHA is an essential **omega-3** long-chain polyunsaturated fatty acid crucial to help develop:

DHA can contribute to cognitive and retinal development, as well as trainability.

KEY ASPECTS OF A KITTEN OR PUPPY'S GROWTH PERIOD

DEVELOPING IMMUNE SYSTEM

Between 4 and 12 weeks, your kitten or puppy goes through a crucial period of immune development—the immunity provided by the mother gradually declines, but their own defenses are not yet fully functioning.

DEVELOPING DIGESTIVE SYSTEM

After weaning, your kitten or puppy's digestive system is not yet mature, and it is not yet ready to assimilate large amounts of food at one time.

OVERALL HEALTHY GROWTH

During the growth phase, the kitten or puppy's energy requirements are higher than those of an adult. Caloric intake must be measured to precisely meet the animal's needs and to help maintain a healthy weight during the growth phase.

NUTRITION TO SUPPORT THEIR UNIQUE NEEDS

FOR KITTENS AND PUPPIES WITH GASTROINTESTINAL NEEDS

- ❑ Gastrointestinal Kitten*
- ❑ Gastrointestinal Puppy*
